Assignment 2

- Use [yts movie api](#) to get list of movies. Use list movies endpoint first.
- Try to add button to load next page list too because there is limit in movie count on one page.
- Display each movie in a card containing movie name, movie image, made year.
- Clicking each movie should navigate to detailed movie page. You can use another movie detail endpoint but it requires movie id, which you can get from list movie endpoint.
- In detailed page, show movie description, actors, rating, runtime and download size in different quality.
